

Multiprogramming ⇒ degree of Multiprogramming ↑

Ex 1 RAM = 4 MB
process = 4 MB ⇒ $\frac{4 \text{ MB}}{4 \text{ MB}} = 1 \text{ processor}$

100 ⇒ 1 70% k' time ⇒ I/O Bound
eg 30% 1 - k ⇒ CPU Bound = 30%

Ex 2 RAM = 8 MB ⇒ 2 processor
process = 4 MB

1 process → k time
70% 2 processor ⇒ k * k ⇒ k²
70% I/O Bound, CPU Bound = ?

k² ⇒ I/O Bound
(1 - k²) ⇒ CPU Bounds
(1 - (0.7)²) ⇒ 0.5

Ex. RAM = 16 MB
process = 4 MB $\frac{16 \text{ MB}}{4 \text{ MB}} = 4 \text{ processors}$

70% (1 - k⁴) = (1 - (0.7)⁴) ? %

Contiguous allocations

Fixed / Dynamic /

Static

Variable

Fixed Partition / static

- Partitions are fixed

- Size of partition is fixed

- Disadv

- 1) Internal fragment

- 2) Limit for processing

- 3) Limitation for degree of multiprogramming.

$P_1 = 4\text{ MB}$

$P_2 = 7\text{ MB}$

$P_3 = 6\text{ MB}$

$P_4 = 2\text{ MB}$

$P_5 = 1\text{ MB}$

$P_6 = 8\text{ MB}$

Variable partitioning / Dynamic partitioning

Fixed

Variable

External fragment

$P_1 = 2\text{ MB}$ ✓

$P_2 = 4\text{ MB}$ ✓

$P_3 = 8\text{ MB}$ ✓

$P_4 = 8\text{ MB}$

P_4 cannot allocation

Space is not contiguous

$P_5 = 5\text{ MB}$

External fragmentation

2) External

Advantages

- Internal fragmentation is compromised
- No limitation on no. of processes
- No limitation on the process size

Disadvantages

- External fragmentation
- Allocation / Deallocation becomes complex
- No. of holes are more as compared to no. of process.

Compaction → free space (holes)

Apply Compaction

Collect the free space available in the memory

Strategies to allocate the process

1. First fit

2. Next fit

3. Best fit

4. Worst fit

first allocation \rightarrow first fit

Worst fit

$\frac{12MB}{8MB} \Rightarrow$ Waste

Next fit

Best fit

Example

P1 = 3MB ✓

P2 = 7MB

P3 = 7MB

P4 = 1MB

Fixed \rightarrow Variable

Ex:

$\frac{P5 = 2MB}{?}$

4MB \rightarrow first fit (fragmentation)
2MB \rightarrow Best fit \rightarrow
